

Petter Norrman

/ Senior Software Engineer

Senior Software Engineer with recent assignment at IKEA in the selling range team, delivering diverse information for a global product range. Over four years led development on AWS and participated in a platform transition from API-driven services in AWS to an event-based architecture on GCP to enable near real-time product updates. Strong background in Go and Java with cloud-native design and rapid onboarding of new technologies. Business-focused, reliable and senior contributor who consistently delivers, adapts to incomplete specs, and invests extra effort for team and project success.

/ Highlighted assignments

Senior Backend Developer

IKEA (INGKA)

Jan 2019 - Jul 2024

Backend developer in IKEA's Selling Range team, building global APIs handling over six billion monthly requests at 80,000 requests per second. Works end-to-end in an autonomous DevOps team and has also worked with Java-based legacy systems using Spring Boot and Hibernate. Supports the transition from AWS APIs to event-driven GCP architecture for near-real-time product updates.

Techniques

Java
Golang (Go)
REST API

Tools

Spring Boot
Spring Framework
Terraform
Confluence
Git
Maven

Platforms

Amazon Web Services
GCP
EC2
GitHub Actions
Oracle

Products

Docker
SAP SRM
Jenkins

Pub/Sub
Cloud Run

Methods & Processes

Continuous Integration
Agile/Scrum

/ Relevant projects and assignments

IKEA

Senior Software Engineer

Jan 2026 - Ongoing

Developed and maintained a dbt-based SSAD data transformation project to produce a unified enterprise data model for assets, locations, spaces, and business units. Integrated datasets from SharePoint, CAFM, Unifier, and CMP into a consistent reporting layer using SQL transformations, data mapping, and master data management to improve data quality and operational consistency.

Created reusable dbt models, macros, and seed tables to support hierarchy mapping, classification logic, and standardized reporting. Implemented automated data quality checks and validation tests to ensure accuracy before deployment. Concurrently developed an SDI population tool in Java with Spring Boot, jOOQ, and PostgreSQL to ingest source data, validate rows against SDI specifications, and generate Excel export files for downstream consumers.

Deployed and automated workloads on Google Cloud Platform, leveraging Cloud Run for serverless execution, Cloud Scheduler for recurring jobs, Secret Manager for secure credentials, and Airflow for workflow orchestration. Managed access and deployment via service accounts, IAM, and CI/CD pipelines to enable repeatable, production-ready execution across dev/stage/prod environments.

GCP services and deployment:

- Cloud Run: Serverless execution for dbt jobs and task workloads.
- Cloud Scheduler: Scheduling recurring data processing jobs.
- Secret Manager: Secure storage and injection of environment secrets (API keys, credentials).
- Airflow on GCP: Orchestration and coordination of data workflows.
- Service Accounts / IAM: Secure access management between services.
- GitHub Actions + GCP deployment automation: CI/CD for deploying Cloud Run jobs across environments.

Techniques, methodologies, and tools:

- dbt: Transform raw data into structured warehouse models using SQL.
- SQL: Clean, merge, aggregate, and validate source data.
- Data modeling & ETL/ELT: Design logical/physical SSAD structures and pipeline processes.
- Data integration & master data management: Consolidate sources and standardize key entities (assets, locations, spaces, business units).
- Data mapping, cleansing, reconciliation, and schema validation: Align fields, correct inconsistencies, and verify structures.
- Seed data & SQL macros: Maintain lookup tables and reusable transformation logic.
- Business rule implementation: Encode hierarchies, classifications, and operational definitions.
- PostgreSQL: Storage and transformation outputs; source queries.
- Java / Spring Boot / jOOQ: Backend SDI tool development with type-safe database access.
- REST APIs & Excel export generation: Expose endpoints and produce SDI workbooks for business validation.
- Batch processing, validation/reject handling, and error workbook generation: Process large record sets, flag invalid rows, and provide readable error reports.
- Workflow automation, Docker, CI-style validation, database-first development, and API-driven data access: Ensure consistent environments, pre-deployment quality gates, reliable schema-driven code, and programmatic data access.

Sony

Senior Software engineer

Aug 2025 - Jan 2026

Working in the Software Security Systems team with the tool chain for handling firmware for Android phones, TVs and cars.

Main language: Java version 21

Spring - development framework

Jakarta EE - historic Web UI to be migrated to Spring

Maven - build tool and dependency-management

Apache Ant - build tool and dependency-management

AWS:

S3 - Simple Storage Service, different types of data like firmware and client logs for analysis

EC2 - used for Java hosting

ELB - (Elastic) Load Balancing

VPC - Virtual Private Cloud

RDS - Relational Database Service - MySQL

CloudWatch - for log handling and alerts

GuardDuty - Threat detection

Miscellaneous:

Docker - Deployment of web services
 REST APIs - Used architecture for web services
 X.509 - Certificate management, root-/company-/user-authentication and encryption
 Jenkins - build-server and deployment
 Curl - REST invocations & testing
 Jira - ticket tracking
 Confluence - documentation

Spring Framework, Java, Jenkins, EC2, Amazon Web Services, VPC, Docker, Apache Ant, Maven, X.509, REST API, RDS, Cloud Storage, cURL, Confluence, Amazon GuardDuty, Elastic Load Balancing, JIRA Confluence, Jakarta EE, Cloud watch

Non-disclosure customer

Senior Software Engineer

Jan 2025 - Aug 2025

Contributed to a solution for an EV charging station provider using Java and deployed on AWS. The solution received power limit events conforming to the OpenADR 3.0 standard from multiple electricity suppliers authenticated via OAuth 2.0. It persisted events in AWS DynamoDB and scheduled or executed temporary shutdowns or power limits on specified EV chargers. Robust error handling was implemented using AWS Alarms, with automated email notifications to report any incidents.

Amazon Web Services, Docker, Amazon DynamoDB, AWS CloudWatch, Amazon SSM, Java 17, Amazon Simple Queue Service, AWS Serverless Application Model (SAM)

IKEA (INGKA)

Senior Software Engineer

Jan 2019 - Jul 2024

Current assignment at IKEA since January 2019.

Working in the Selling Range team in a DevOps way developing REST APIs written in Go (Golang) to provide product information, availability status, price information and product location information for the whole IKEA product range globally.

The APIs can handle large loads, more than 6 billion requests per month at normal 80,000 requests-per-second, with on-demand autoscaling setup providing accurate information for more than 160 different API consumers/teams.

The team composition has changed over the years but has mainly consisted of five to eight autonomous developers which has all had the roles of tester, scrum-master, planner, support and architectural designer.

The product has started transitioning from API based architecture in Amazon Web Services (AWS) to event-based architecture in Google Cloud Platform (GCP) to provide near real-time product information updates.

Development tools: Go (Golang), Terraform, GitHub actions (CI/CD), Swagger/OpenAPI, Docker, Bash, Makefile, Akamai (Content Delivery Network), team developed support tools

Amazon Web Services (AWS): Lambda, DynamoDB (with cross region replication), S3, API Gateway, CloudWatch, Serverless Framework, Simple Queue Service, CodeBuild, CodePipeline, EC2, EKS, Route 53, X-Ray, CloudFormation

Google Cloud Platform (GCP): Cloud Run, Datastore, BigQuery, APIs & Services, Pub/Sub, Observability, Protocol Buffers, Compute Engine, Cloud Storage, Container Registry

Technology in legacy systems used to a limited extent: Oracle Database, Java (Spring Boot, Lombok, Hibernate), Python, OpenShift, Jenkins build automation

Java, Amazon Web Services, Continuous Integration, Docker, Go, Swagger, Amazon DynamoDB, Cloud Storage, Python, Terraform, Akamai, GCP, GitHub Actions, Container Registry, Pub/Sub, Datastore, Compute Engine, Cloud Run, APIs & Services

Stockholms Lokaltrafik

Senior Java Developer / Architect

Aug 2016 - Jan 2019

Java backend development and frequent decisions in architecture when requirements have sometimes been deficient. Together with a team from Knowit, Petter has built an "end-to-end" system for Stockholm's Lokaltrafik. Everything from Embedded/IoT to native app has been built by the team in Malmö and Petter has been responsible for the Java/Backend layer. Mobile tickets and automated ticket validation with BoB (Ticket and Payment Standard) created by Samtrafiken. They have lifted and modernized parts of the platform and replaced Mobill with MBS (Mobile Ticket System) with Swish, Klarna and Payex and added TLS/SSL encrypted traffic between the systems.

MySQL, Java, SSL, Maven, API

Sony Mobile Communications

Senior Java Developer

Oct 2013 - Aug 2016

Architectural preliminary study before rewriting existing integration for customer support web, with the aim of reducing the number of techniques and matching to an existing platform.

Investigate and correct existing program defects that have been unresolved for a long time.

Deliver a preliminary study where the previous customer support web is to be rewritten for the WordPress platform and where, by reducing the techniques for development, it is possible to give the customer an implementation with shorter lead times and greater opportunity for the use of agile development methods.

Point effort for debugging a complex Java integration in order to locate a specific number of software defects that were difficult to reproduce.

He used Eclipse with Java 1.6-1.7, Apache Tomcat, Apache HTTP server, Amazon Web Services, Amazon CloudFront, Amazon Simple Storage Service (S3), Amazon Elastic Compute Cloud (EC2), Amazon Elastic Load Balancing (EC2-ELB), Amazon Relational Database Service (RDS), AWS SDK for Java, Spring Framework, WordPress, PHP, HTML, XML, CSS, Javascript, JSP, AngularJS, Apache Maven, REST, GIT, Jira Confluence, Single Sign On, LDAP

Spring Framework, Java, EC2, Amazon Web Services, Jira Agile

IKEA IT

Senior System Developer

Feb 2011 - Aug 2013

Development in Java, interpret requirements, write design and implementation solutions, knowledge transfer workshops.

In project form developed integration to retrieve product and price information from information hub (IX) to populate/update database with basic data for web catalog and e-commerce on IKEA's global web.

Eclipse with Java 1.5, Rational Software Modeler, ITF Java Framework 5 and 6 (IKEA specific), Enterprise Business Components, PL/SQL Oracle 10g/11g, TDD, JUnit 3/4, Hibernate, Spring Framework, Apache Tomcat, Jetty, Maven, Rational ClearCase/ClearQuest, BASH scripts, BMC Control-M, SCRUM

Hibernate, Spring Framework, Java, PL/SQL

Bergendahlsgruppen

Senior SAP Netweaver Consultant

Jan 2009 - Jan 2011

Design and setup of virtual server hardware. Security audit. Installation of ERP database.

VMware vCenter

CDON

Software Engineer

Apr 2000 - Apr 2007

Project Manager, Software Engineer, System Developer och System Administrator Team Lead
