

Mohammed Al-Eryani

/ Senior Software Engineer

I am an Senior Software Engineer and Technical Architect with extensive expertise in .NET, Entity Framework, React, TypeScript, and Azure. My professional focus revolves around designing and implementing scalable solutions, enhancing system performance, and configuring reliable CI/CD pipelines using Azure DevOps.

Beyond my technical proficiency, I am committed to collaboration and leadership. I excel at client communication, requirements analysis and translating ideas into innovative and practical solutions. My dedication extends to mentoring teams, fostering development and driving projects to successful completion.

As a certified Artificial Intelligence specialist, I am passionate about exploring ways to integrate intelligent systems into modern software architectures.

/ Highlighted assignments

Senior Software Engineer

Inter Ikea Systems B.V.

Aug 2020 - Ongoing

Senior Software Engineer and Technical Architect who turns complex e-commerce needs into scalable, high-performing .NET cloud solutions. Azure expert with strong capabilities in APIs, CI/CD, monitoring, security and payments. Combines hands-on engineering with architectural leadership, mentoring and cross-team delivery to accelerate technology adoption and business value.

Senior Software Engineer

Volvo Car Retail Solutions

Jan 2017 - Jan 2019

Senior Software Engineer who delivered a scalable e-commerce platform for seamless car-service bookings. Modernized the API into microservices and managed the full delivery lifecycle across .NET, Angular, Azure, Terraform and CI/CD. Strengthened performance and deployment reliability with Gatling, Docker, Helm and Kubernetes—accelerating releases and creating a robust customer experience.

Inter Ikea Systems B.V.

Senior Software Engineer

Aug 2020 - Ongoing

As a Senior Software Engineer and Technical Architect specializing in the E-commerce domain, I design and implement scalable, high-performance cloud solutions utilizing the latest versions of .NET. I oversee the creation and maintenance of a unified API layer that powers front-end applications across multiple countries, with localization efficiently managed through configuration within a single, maintainable codebase.

The technology stack incorporates Azure services, including App Services, Function Apps, Cosmos DB, Redis, Service Bus, Cosmos DB, Key Vault, and API Management Gateway, ensuring high reliability, robust security, and optimal performance. I possess extensive experience integrating with various payment providers and developing secure, compliant systems that adhere to architectural best practices and data protection standards.

My key responsibilities include:

- Designing scalable, maintainable systems that align with both business and technical requirements.
- Managing CI/CD pipelines in GitHub and Azure DevOps, fully automated with YAML-based configurations.
- Implementing advanced monitoring and observability tools, leveraging Azure Application Insights and Grafana to enable proactive issue detection and performance optimization.
- Securing services through OAuth2 authentication while managing API access via Azure API Gateway.
- Collaborating with cross-functional teams, including UX, QA, Front-End, and other product teams within IKEA, to ensure seamless integration and delivery across interdependencies.
- Establishing coding standards, performing code reviews, and maintaining best practices for performance, scalability, and cloud architecture.
- Mentoring developers and fostering technical excellence across teams.
- Assessing and adopting emerging technologies to enhance system quality and developer productivity continuously.

Azure, eCommerce, Architect, SQL Database, Jira SCRUM/KAMBAN, Back-End, Azure CosmosDB, Azure DevOps, .NET, YAML pipeline, Claude, GitHub Copilot / Agentic workflows

IKEA E-com Solution

Senior Software Engineer

Jan 2019 - Jun 2020

As a Senior Software Engineer, I designed, built, and maintained a dynamic Profile Management and Support Portal to empower family members to seamlessly manage their profiles, update preferences, monitor membership status, and review detailed store point histories. Additionally, the application included an integrated support portal, enabling users to create tickets and engage in real-time chats with customer service representatives, all within a modern Single-Page Application (SPA) interface.

On the back end, I developed and maintained robust .NET Core APIs responsible for implementing business logic, securely accessing and persisting data in an SQL database, and managing integrations with various external services. I also implemented SignalR to deliver seamless real-time chat functionality and integrated Auth0 to ensure secure authentication and authorization across both the front-end and back-end layers.

Key responsibilities included:

- Designing and delivering scalable, maintainable full-stack solutions using .NET Core, React, and TypeScript.
- Implementing real-time communication features with SignalR, ensuring responsive client-server interactions.
- Enhancing application security by implementing secure authentication flows with Auth0 and safeguarding session integrity.
- Collaborating closely with UX and QA in an Agile/Scrum workflow to produce high-quality, timely releases.
- Conducting code reviews, optimizing performance, and upholding best practices to ensure clean, maintainable code.

Agile, SQL Database, TypeScript, API, SignalR, Back-End, Customer Service, Single Page Application, .NET Core, React, Authentication, Scrum

Volvo Car Retail Solutions

Senior Software Engineer

Jan 2017 - Jan 2019

As a Senior Software Engineer, I contributed to the development of both the E-commerce API and the front-end platform for booking car services, empowering customers to schedule appointments, manage bookings, and access service details through a seamless online interface. I significantly contributed to transforming the E-commerce API into a microservices architecture, enhancing scalability, maintainability, and deployment efficiency.

I was responsible for overseeing the entire delivery lifecycle, which included front-end and back-end development, cloud infrastructure automation, and CI/CD pipeline configuration. I established build and release pipelines and automated resource provisioning in Azure, ensuring consistent and dependable deployments across various environments.

Moreover, I implemented performance testing using Gatling, containerized applications with Docker, and managed deployment orchestration through Helm Charts and Kubernetes.

****Key contributions include:****

- Developed and maintained .NET Framework and .NET Core APIs, along with Angular (versions 2 and 5) front-end applications.
- Configured and automated CI/CD pipelines in Azure DevOps to streamline release management processes.
- Automated Azure resource provisioning using Terraform to ensure reliable infrastructure as code.
- Designed and executed performance testing strategies using Gatling to guarantee system reliability under load.
- Utilized Docker, Helm Charts, and Kubernetes for efficient containerization and deployment orchestration.
