

Jacob Wikmark

/ Senior Software Engineer

Jacob is a senior software engineer with experience in building developer-focused solutions, cloud platforms and AI-driven applications. He has extensive experience with Python, APIs, distributed architectures, and Azure/Azure DevOps, incl. CI/CD, infrastructure, deployment automation and platform development. He has developed internal support tooling, web applications and integrations, giving him relevant experience for developer-facing platforms. Jacob has contributed to an AI commerce agent PoC on Azure using Python and Azure AI Foundry, providing experience applying AI technologies in product development. His knowledge of IKEA systems, product information APIs and his data-driven approach to software development, makes him well suited to contribute to the evolution of the ADP platform.

/ Highlighted assignments

Fullstack software developer/engineer

Inter IKEA

Nov 2020 - Ongoing

Jacob has recently been a part of a four-person team that developed a proof of concept for an e-commerce agent. The solution was built using an agent-to-agent architecture, with models hosted in Azure AI Foundry and integrated with several IKEA APIs for product search, listing, comparison and shopping cart interactions. The backend was developed in Python, while the frontend was built in React/TS.

Tester

Kentima AB

Nov 2018 - Sept 2020

Worked with testing of a HMI/SCADA application. Developed GUI test automation frameworks, ran database integration tests, built maintenance and support tooling. Ensured specification compliance. Ran hardware tests on physical devices with industrial interfaces.

/ Highlighted education

Mathematics

Lund University (Lund)

2010 - 2016

Techniques

Python
API
Node.js
Express.js JavaScript library
TypeScript
React.js

Inter IKEA

Senior Software Engineer

Nov 2020 - Ongoing

Jacob works with a global SaaS e-commerce platform for IKEA retail franchisees, currently serving users across 15 markets worldwide. He contributes throughout the entire software development lifecycle, including solution design, development, testing, deployment, operations, and incident management. He has experience working with APIs, integrations, SQL and NoSQL databases, CI/CD pipelines, cloud services, and modern software engineering practices.

A significant part of Jacob's work involves integrating external systems and payment services, troubleshooting production systems, supporting business-critical applications, and ensuring reliable service delivery across multiple markets. He is actively involved in architecture discussions, quality assurance, release management, and operational support.

Jacob was also part of a four-person team that developed a proof of concept for an AI-powered e-commerce agent. The solution was built using an agent-to-agent architecture, with models hosted in Azure AI Foundry and integrated with multiple IKEA APIs for product search, product listing, comparison, and shopping cart interactions. The backend was developed in Python and the frontend in React (TypeScript).

He has extensive experience managing releases to production, maintaining CI/CD pipelines, writing automated end-to-end tests, and handling incident response and operational support in a large-scale international e-commerce environment.

Integrations, Selenium, Microsoft Azure, Node.js, Express.js JavaScript library, TypeScript, API, Python, React.js, OpenCode, Azure AI Foundry Agents
