

Max Barnell

/ Senior Software Engineer

Max is a Senior Software Engineer with expertise in React, TypeScript, Node and modern product environments, gained through several years working on IKEA's digital products. He has collaborated closely with UX/UI teams on implementing and refining designs, while also contributing to larger refactoring and standardization initiatives aimed at creating more scalable, consistent, and user-friendly solutions across products. Max has experience with component-based development, accessibility/WCAG, testing with React Testing Library and Jest, as well as modern development workflows in AWS and Azure environments. He thrives in cross-functional teams where design, frontend, and platform engineering work together to build sustainable solutions with high quality and a strong developer experience.

Fullstack developer

IKEA

Feb 2021 - Aug 2025

I worked on IKEA's new kitchen planner which is their largest planner. I was involved in developing both the frontend & backend using various technologies, incl. Node.js and React together with TypeScript. I worked closely with the UX/UI team with implementing their designs that was created in Figma, as well as working with them iteratively in improving the designs during the development process.

Knowit - AI Innovation Factory

Senior Software Engineer

Feb 2026 - Ongoing

I currently work on an app that is designed to help with list management and particularly when shopping. It is focused on co-operation and real time updates. I am working with this fully with AI, from brainstorming, to prototyping, to development and releasing. It is currently being tested before going live.

To do this I used ChatGPT as my brainstorm AI and we created all the AI-files and guidances that was needed for the project. In tandem I worked with Co-Pilot to create the app, which was still an iterative process where a lot of manual testing and code review took place to make sure it worked. For the UI I used stitch.withgoogle to create the designs of each page.

I also incorporated AI (ChatGPT mini) into the app so that you can take a picture of a list, or a recipe or anything list-wise and it will be able to import it into the app as single items.

TypeScript, Firebase, React Native, AI, Vite, ChatGPT, Copilot

Inter IKEA

Senior Software Engineer

Oct 2025 - Feb 2026

I was in the frontend team on Profile Pages at Inter IKEA, there I used React, Typescript to develop their profile page for the main ikea.com website together with Copilot. We used Azure as our Cloud solution.

Microsoft Azure, TypeScript, WCAG, AI, React

IKEA

Senior Software Engineer

Feb 2021 - Aug 2025

I worked on IKEA's new kitchen planner, which is their largest planner. I was involved in developing both the frontend and backend using various technologies, including Node.js and React together with TypeScript. I worked closely with the UX/UI team with implementing their designs that was created in Figma, as well as working with them iteratively in improving the designs during the development process. I worked with IKEAs in-house components library to get a standardised feel of the planner, they used storybook for those libraries. I wrote tests for the application using Jest and the React Testing Library. Additionally, I worked with AWS Lambdas and frequently debugged using CloudWatch.

The project initially began with JavaScript but transitioned to TypeScript after I had been there for a year. Once the project went live, we embarked on a significant refactoring process to simplify and streamline the entire project, making it more accessible and understandable. This refactor also aligned the Kitchen Planner more closely with other IKEA products in terms of appearance and functionality. For the last 1 year of the project we also used Copilot daily in our work.

Alten

Software developer

Jun 2019 - Jan 2021

I was involved in the creation of a web application that is used for planning, hosting and for giving/receiving feedback seminars and workshops. It is to be used in conjunction with other online technologies and is another tool in the box. The database had to be migrated from Firebase to AWS DynamoDB and at the same time it was restructured to be more efficient.

- Created log in environment on the website that was linked to Cognito
- Created stories on Gitlab
- Documentation

Agile, Git, AWS, TypeScript, GitLab, React

Alten

Software developer

Jun 2019 - Jan 2021

My task was to automate the importation of XML-files into their inhouse tool used for designing railway routes and other assets. It needed to be able to read any XML-file since we could not know in advance what type of structure it would have.

We also automated their placement of fouling points (signals that trains needs to cross before they are allowed to stop to prevent trains from colliding in crossings) along the track during the development.

- Implementation of XPath to import XML-files, could import any XML-file based on a configuration the user used as input
- Eclipse plug-in Development
- Tests for all the features
- Documentation

Eclipse, Java, Jenkins, Git, Gerrit

Human IT

Software Developer

Mar 2019 - May 2019

LIA during studies:

Developed a website used for employee development and its backend. Was involved from the initial planning to the final product we did before our time was up. The criteria was that one should be able to set goals, milestones and other minor plans. It should also be able to share ones goals with other people on the site. There was different sets of users that had different roles, there was restrictions on what could be done based on the different roles.

- Develop a website using Javascript and React
- Implement backend with Spring Boot and MySQL including Auth 2.0
- Planning and story making using Jira, daily standups and working with agile
- Unit tests and documentation

MySQL, JavaScript, JUnit, Java, Spring Boot, JIRA, React

Bayou AB

Software Developer

Apr 2018 - Aug 2018

Worked on a mobile application called Tyra that is used in pre-schools for parents and teachers. It had everything about ones child and was used for communicating and all things related to their school. My goal was to improve on the schedule, I was to implement templates that could be used to fill out their schedule, rather than going week by week and filling it out like it was when I got there. The template should be able to fill in each week, every two weeks or alternating each week, etc.

- Android Studios Development with Kotlin
- Planning and documentation of the feature

Java, Trello, Android Studio, Parse, Kotlin
