

Adnan Ali

/ Senior Software Engineer

Results-driven senior software engineer specializing in backend and cloud-native solutions. Designs, develops and maintains scalable applications using C#, .NET, SQL Server and Microsoft Azure, with proven experience in microservices, RESTful APIs, distributed systems and event-driven architectures using Azure Service Bus and Functions. Builds high-performance services for international e-commerce, implements robust integrations and automates CI/CD with Azure DevOps and GitHub Actions. Focused on performance optimization, system reliability, clean code and agile collaboration; actively employs AI-assisted tools like GitHub Copilot to accelerate delivery and improve code quality.

Inter Ikea

Software Engineer 2026

As a Software Engineer specializing in backend development within the E-commerce domain at IKEA, I develop, enhance, and maintain scalable, cloud-native Cart and Checkout services using C#, modern .NET, and Microsoft Azure.

Netigate

Software Developer 2022 - 2025

Developed a feedback web application designed to automate survey distribution for collecting user feedback, enabling robust reporting and analytics. The application also promotes employee engagemen, creating a dynamic feedback culture within the organization.
Focused on designing and developing microservices using C# and .NET (including .NET 8/9) within a distributed, event-driven architecture.

/ Highlighted education

Msc in Computer Science and Informatics, WO 2016 - 2018
Roskilde University

Bsc in IT and Economics, Syddansk Universitet, HBO 2010 - 2014

/ Relevant projects and assignments

Inter Ikea

Software Engineer

Mar 2026 - Nov 2026

As a Software Engineer specializing in backend development for IKEA's e-commerce platform, I develop and maintain scalable, cloud-native Cart and Checkout services using C#, modern .NET, and Microsoft Azure.

The services support international markets, including Asia, the Baltics, Kuwait, and Mexico. Working with a unified backend API platform, I deliver reliable, high-performance solutions that meet market-specific requirements through configurable, maintainable services.

My work includes RESTful APIs, distributed system integrations, and event-driven processing using Azure Service Bus and Azure Functions. The stack also includes Azure App Services, Cosmos DB, Redis, Key Vault, API Management, and Application Insights.

I contribute to CI/CD automation, cloud infrastructure integration, monitoring, and improvements in code quality, performance, security, and maintainability.

Key Responsibilities and Contributions

Backend Development: Design, develop, and optimize RESTful APIs and microservices using C#, ASP.NET Core, and modern .NET for IKEA's Cart and Checkout platforms.

Azure Cloud Services: Develop and maintain cloud-native applications using Azure App Services, Functions, Service Bus, Cosmos DB, Redis, Key Vault, and API Management.

System Integration: Integrate internal services, external systems, and payment providers, ensuring secure communication and reliable transaction processing.

Event-Driven Architecture: Implement asynchronous messaging and processing with Azure Service Bus and Azure Functions to improve scalability and resilience.

CI/CD and DevOps: Build and improve automated deployment pipelines using Azure DevOps, GitHub Actions, and YAML configurations.

Monitoring and Troubleshooting: Investigate production issues and improve application health, performance, and observability using Application Insights, Grafana, and structured logging.

Security and API Management: Implement secure integrations using OAuth2, authentication and authorization, Azure Key Vault, and API Management.

Code Quality: Review code, write automated tests, refactor implementations, and apply clean code principles and engineering best practices.

AI-Assisted Development: Use GitHub Copilot, Copilot Agents, and AI-assisted workflows for implementation, unit testing, refactoring, and troubleshooting, with developer review to ensure quality and security.

Cross-Functional Collaboration: Work with frontend developers, QA engineers, architects, and IKEA product teams to deliver reliable solutions and manage cross-service dependencies.

Continuous Improvement: Contribute to technical discussions, evaluate technologies, and improve system maintainability, development workflows, and engineering practices.

Culligan

Full-Stack Software Developer

Dec 2025 - Mar 2026

Design and delivering a customer facing administrative web portal integrating with IFS Cloud, enabling secure customer self-service and operational insights. The platform allows customers to request role-based access with granular authorization claims and provides administrators with a centralized dashboard for managing users and viewing critical business data, including customer payments, recurring services, and aging analysis through direct IFS Cloud API integrations.

Responsible for the end-to-end solution architecture and delivery across backend, frontend, and DevOps domains. The backend is implemented in .NET 9 with a Microsoft Azure–hosted SQL database, exposing RESTful APIs compliant with OpenAPI specifications to support scalability, maintainability, and external system integration.

The frontend is built using React with a Node.js server, delivering a responsive and secure user experience. Authentication and authorization are implemented using JWT-based security principals, ensuring secure access control and validation of user claims across the platform.
Leading cloud deployment, CI/CD pipelines, and environment configuration to ensure reliability, security, and performance of the application in production.

Inter Ikea

Software Engineer

Aug 2025 - Nov 2025

Focused on developing a high-performance, cloud-native .NET web application called Coworker Sales Tool, designed to create and manage sales orders for IKEA products within Microsoft Dynamics 365. The application leverages .NET 10, integrating MartenDB for event sourcing and document storage, and Wolverine to enable reliable, asynchronous messaging between services.

As part of the development process, I designed and implemented RESTful APIs that comply with OpenAPI specifications, ensuring consistent and maintainable service integrations. The solution runs as a set of microservices using .NET Aspire, containerized with Docker to provide scalable and portable environments.

My work also included continuous integration and deployment pipelines through GitHub Actions and Azure DevOps, enabling automated testing, version control, and dependable delivery to production. In addition, Adnan has proactively worked on performance optimization, error handling, and improving system reliability and observability through detailed logging and metrics.

Netigate

Software Developer

Jan 2022 - Jul 2025

Worked on a Feedback web application designed to automate survey distribution for collecting user feedback, enabling robust reporting and analytics. The application also promotes employee engagement, creating a dynamic feedback culture within the organization.

On a daily basis, I focused on designing and developing microservices using C# and .NET (including .NET 8/9) within a distributed, event-driven architecture. I also implemented event sourcing with MartenDB on top of PostgreSQL, ensuring reliable, audit-capable systems with clear state history. To support scalable communication, services were integrated with Kafka for asynchronous messaging.

For deployment and scalability, I containerized services using Docker and orchestrated them with Kubernetes, achieving high availability and resilience. Continuous integration and delivery pipelines were set up and managed through Azure DevOps, automating build, test, and deployment processes across environments.

Collaboration was key, I worked closely with DevOps, QA, and product teams in an Agile environment to continuously improve workflows and service reliability. Additionally, I integrated third-party services such as Microsoft Entra SCIM, Salesforce, authentication providers, and secure key vaults for data encryption using RESTful APIs, OAuth2, and WebHooks. Close coordination with frontend teams ensured well-defined API contracts and improved system reliability.

Beyond development, I also conducted code reviews and mentored junior developers on C# and .NET best practices, fostering a culture of quality and continuous learning.

Lime Technologies (Lundalogik)

Application Developer

Sept 2017 - Jan 2022

My main focus was on developing and maintaining a CRM platform. On a daily basis, I worked primarily with C# .NET, Python, SQL Server, React, and leveraged Jenkins for DevOps automation.

I automated numerous data integration and ETL processes using SSIS and T-SQL, ensuring efficient and reliable data workflows. Additionally, I integrated third-party ERP systems and APIs with Lime CRM, enabling seamless interoperability between platforms.

I had a close collaboration with customers, QA teams, and product teams to refine requirements and troubleshoot production issues, ensuring high-quality delivery and user satisfaction.

Siemens

Software Developer — May 2017 - Sept 2017

Worked on the Siemens mobility software used for railway infrastructure.
- Software development in C#, C++.
- Database administrator in SQL server.
- Using Jenkins for CI/CD DevOps.

Servisio Denmark

Software Developer — Jan 2015 - May 2017

Developed and maintained a Windows-based application for tracking course attendance and generating reports using Crystal Reports. The tool was primarily used by municipalities to manage training records and produce formal documentation.

- Building Desktop application using WinForms and WPF in C# .NET.
- Database administrator in SQL server. Performing/optimizing complex queries for performance.
